

IoT-based Smart Anti-Spillage System for Water Tankers

This is an **IoT-based Smart Anti-Spillage System for Water Tankers** designed to ensure safe, efficient, and automated water transport. It features smart lid control, automated valves, and intelligent in-loading systems to prevent overflow and leaks. With IoT monitoring and driver-safety mechanisms, it enhances operational control and reduces accidents on the road.

1. The smart lid control system uses a pressure sensor and motorized lid to safely release excess pressure without opening the tank manually.
2. The automated outlet valve allows drivers to release water precisely using a cockpit button, preventing leaks and wastage.
3. The smart in-loading system automatically stops the source pump when the tanker is full and restarts it when an empty tanker arrives.
4. IoT monitoring helps track water levels, pressure, and outlet status remotely for better control and fleet management.
5. The system improves driver safety by reducing the need for manual lid opening and preventing overfilling accidents.

In conclusion, the IoT-based Smart Anti-Spillage System for Water Tankers provides a modern, automated solution to traditional tanker challenges. By integrating smart sensors, motorized controls, and IoT monitoring, it ensures safe operation, efficient water management, and enhanced driver safety. This innovation not only minimizes water wastage and spillage but also contributes to smarter, more sustainable transportation practices.
